## QC and SYNTHESIS POSITION

aquaTECH is a Geneva-based company developing and producing polymers for water treatment. This includes potable and waste water, as well as the treatment of foods such as sugar and oils, where the vast majority of our molecules are approved for use. We have programs in valorizing waste and these including cleaning water to convert the residues into sellable assets. We also have activities in the paper sector, where we have innovative solutions to help machines run faster with less energy. Our firm, which was voted to top environmental company in Europe by the Wall Street Journal carries out development for personal care ingredients. All of these are based on our core competencies in polyelectrolytes and emulsions.

We are looking for a collaborator to spend 2-3 months with us to work on some development projects and learn the base of synthesis, while participating in quality control. The position is based in Geneva, and the factory is in Avully, on the Swiss-French border. The position would, ideally, be for 2013 though we could consider early 2014.
